

# Cluster and Cloud Computing Assignment 1 – HPC Instagram GeoProcessing

## Problem Description

Your task in this programming assignment is to implement a simple, parallelized application leveraging the University of Melbourne HPC facility SPARTAN. Your application will search a large geocoded Instagram dataset to identify Instagram usage (aka *posts*) hotspots around Melbourne.

You should be able to log in to SPARTAN through running the following command:

```
ssh your-unimelb-username@spartan2.hpc.unimelb.edu.au
```

with your University password. Thus I would log in as:

```
ssh rsinnott@spartan2.hpc.unimelb.edu.au
```

If you are a Windows user then you may need to install an application like Putty.exe to run *ssh*.

The files to be used in this assignment are accessible at:

- [/data/projects/COMP90024/bigInstagram.json](#)
  - this is the main JSON file to use for your final analysis and report write up
- [/data/projects/COMP90024/smallInstagram.json](#)
  - smallInstagram.json this a 32Mb JSON file should be used for final testing, i.e. do not use the bigInsta
- [/data/projects/COMP90024/tinyInstagram.json](#)
  - tinyInsta for development and testing, i.e. at the risk of being repetitive, do not use the bigInstagram.json file for software development and testing.
  - You may also decide to use the JSON files on
- [/data/projects/COMP90024/melbGrid.json](#)
  - this is a small JSON-based Grid file for Melb

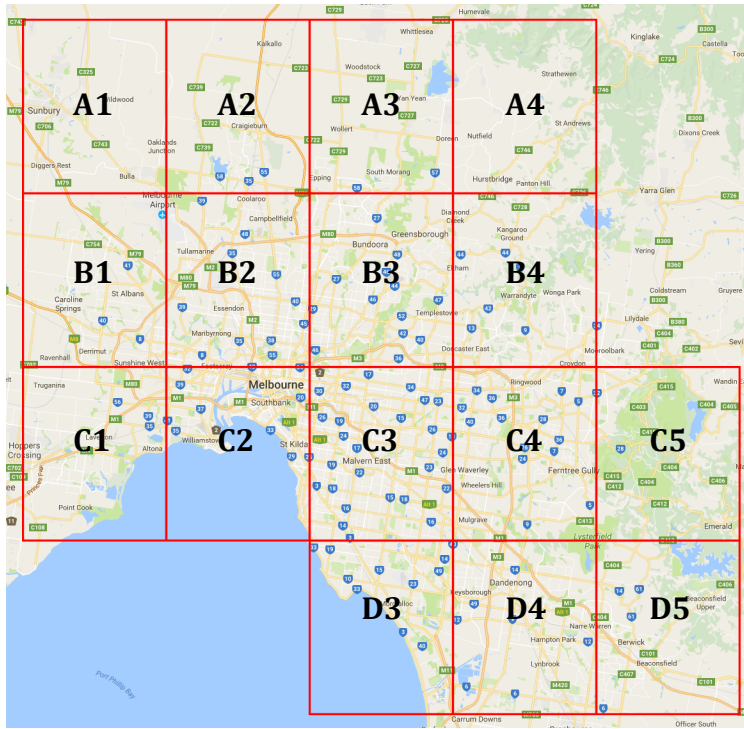

You should make a symbolic link to these files, i.e. you should run the following commands at the Unix prompt **from your own user directory on SPARTAN**:

```
ln -s /data/projects/COMP90024/bigInstagram.json
ln -s /data/projects/COMP90024/smallInstagram.json
ln -s /data/projects/COMP90024/tinyInstagram.json
ln -s /data/projects/COMP90024/melbGrid.json
```

Once done you should see something like the following in your home directory:

```
lrwxrwxrwx  1  rsinnott  unimelb          40  Mar  22  15:06  bigInstagram.json  ->
/data/projects/COMP90024/bigInstagram.json
lrwxrwxrwx  1  rsinnott  unimelb          39  Mar  22  15:06  smallInstagram.json  ->
/data/projects/COMP90024/smallInstagram.json
lrwxrwxrwx  1  rsinnott  unimelb          38  Mar  22  15:06  tinyInstagram.json  ->
/data/projects/COMP90024/tinyInstagram.json
lrwxrwxrwx  1  rsinnott  unimelb          41  Mar  22  15:06  melbGrid.json  -> /data/projects/COMP90024/melbGrid.json
```

The *melbGrid.json* file includes the latitudes and longitudes of a range of gridded boxes as illustrated in the figure below, i.e. the latitude and longitude of each of the corners of the boxes is given in the file.

Your assignment is to (eventually!) search the large Instagram data set (*bigInstagram.json*) to identify Instagram activity around Melbourne. Specifically you should:

- Order (rank) the grid boxes based on the total number of Instagram posts made in each box and return the total count of posts in each box, e.g.
  - C3: 123
  - B2: 122
  - D1: 121
  - ...
  - Down to the square with the least number of posts;
- Order (rank) the rows based on the total number of post
  - B-Row: 567,890 posts,
  - A-Row: 456,789 posts,
  - C-Row: 234,567 posts,
  - D-Row: 123,456 posts.
- Order (rank) the columns based on the total number of posts in each column, e.g.
  - Column 3: 789,012 posts,
  - Column 2: 678,901 posts,
  - Column 4: 567,890 posts,
  - Column 1: 456,789 posts,
  - Column 5: 123,456 posts

(Obviously these numbers are representative of how many posts each box contains!)

An individual post can be considered to occur in the box if its geo-location information (the post latitude and longitude given by the post coordinates) is within the box identified by the set of coordinates in *melbGrid.json*. It should be noted that the file *bigInstagram.json* includes many posts that are not in this grid, e.g. they are from other Australian cities or from other parts of Victoria. You should filter/remove these posts since only the posts in the grid boxes identified here are of interest.

Your application should allow a given number of nodes and cores to be utilized. Specifically **your application should be run once** to search the *bigInstagram.json* file on each of the following resources:

- 1 node and 1 core;
- 1 node and 8 cores;
- 2 nodes and 8 cores (with 4 cores per node).

The resources should be set when submitting the search application with the appropriate *SLURM* options. Note that **you should run a single SLURM job** three separate times on each of the resources given here, i.e. you should not need

to run the same job 3 times on 1 node 1 core for example to benchmark the application. (This is a shared facility and 280+ students will consume a lot of resources!).

You can implement your search using any routines that you wish from existing libraries however it is strongly recommended that you follow the guidelines provided on access and use of the SPARTAN cluster. Do not for example think that the job scheduler/SPARTAN automatically parallelizes your code – it doesn't! You may wish to use the pre-existing MPI libraries that have been installed for C, C++, Python or Java. You should feel free to make use of the Internet to identify which JSON processing libraries you might use.

Your application should return the final results and the time to run the job itself, i.e. the time for the first job starting on a given SPARTAN node to the time the last job completes. You may ignore the queuing time. The focus of this assignment is not to optimize the application to run faster, but to learn about HPC and how basic benchmarking of applications on a HPC facility can be achieved and the lessons learned in doing this on a shared resource.

### Final packaging and delivery

You should write a brief report on the application – **no more than 3 pages!**, outlining how it can be invoked, i.e. it should include the scripts used for submitting the job to SPARTAN, the approach you took to parallelize your code, and describe variations in its performance on different numbers of nodes and cores. Your report should also include a single graph (e.g. a bar chart) showing the time for execution of your solution on 1 node with 1 core, on 1 node with 8 cores and on 2 nodes with 8 cores.

### Deadline

The assignment submitted to the lecturer via LMS. The zip file must be named with your Forename-Surname-Student ID, e.g. <Joe-Smith-0123456>.zip.

The deadline for submitting the assignment is: **Monday 9<sup>th</sup> April (by 12 noon!)**.

**It is strongly recommended that you do not do this assignment at the last minute, as it may be the case that the Spartan HPC facility is e available! You have been warned...!!!!**

### Marking

The marking process will be structured by evaluating whether the (your report) is compliant with the specification given. This implies the following:

- A working demonstration – **50% marks**
- Report and write up discussion – **40% marks**

Timeliness in submitting the assignment in the proper format is important. **A 10% deduction per day will be made for late submissions.**

You are free to develop your system where you are more comfortable with (at home, on your PC/laptop, in the labs, on SPARTAN itself - but not on the *bigInstagram.json* file until you are ready!). Your code should of course work on SPARTAN.
