## University of Melbourne, March 22, 2018

lev.lafayette@unimelb.edu.au

"This is an advanced course but we get mixed bag: students that have 5+ years of MPI programming on supercomputers, to students that have only done Java on Windows."

- Some background on supercomputing, high performance computing, parallel computing, scientific computing (Accessignment, to Performance computing).
- An introduction to Spartan, https://eduassistpro.github.io/
- Logging in, help, and envir
- Job submission with Slurm workload manager; edu\_assist pro multicore, job arrays, job dependencies, interactive jobs.
- Parallel programming with shared memory and threads (OpenMP) and distributed memory and message passing (OpenMPI)
- Tantalising hints about more advanced material on message passing routines.

'Supercomputer" arbitrary term with no specific definition. In general use it means any single computer system (itself a contested term) that has exceptional processing power for its time. A well-adopted metric is the number of floating-point operations per second (FLOPS) such a system can carry out.

Supercomputers, like any other computing system, have improved significantly over time. The Top500 list is based on FLAPS using LINPACK of Exchange it perpender, more interesting metric. The current number #1 system is Sunway TaihuLight, a supercomputer operated by China's National Super Comput

High-performance computing (HPC) is any computer system whose architecture allows for above average performance. A system that is one of the most powerful in the world, but is poorly designed, could be a "supercomputer".

Clustered computing is when two or more computers serve a single resource. This improves performance and provides Acquidance into feith Exam. For such that there are a collection of smaller computers strapped together with a high-speed local network (e.g., Myrinet, InfiniBand, 10 Gigabit Ethernet)

Even a cluster of Raspberry Pi where the could certainly be used. Even a cluster of Raspberry Pi where the could certainly be used. Lego chassis (University of Southampton, 2012)!

Add WeChat edu\_assist\_pro

Horse and cart as a computer system and the load as the computing tasks. Efficient arrangement, bigger horse and cart, or a teamster? The clustered HPC is the most efficient, economical, and scalable method, and for that reason it dominates supercomputing today.

With a cluster architecture, applications can be more easily parallelised across them. Parallel computing refers to the submission of jobs or processes over multiple processors and by splitting up the data or tasks between them (random number generation as data parallel, driving a vehicle as task parallel).

Research computing is the software applications used by a research community to aid research. Does not necessarily equate with high performance computing, or the use of clusters. This skills gap is a major problem and must be addressed because as the volume, velocity, and variety of datasets increases then research ss this data.

https://eduassistpro.github.io/

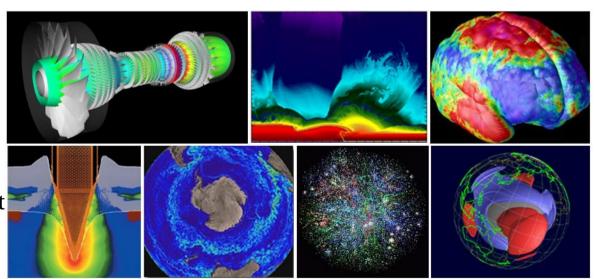

Computational capacity does have a priority (the sy t prior to use), in order for that capacity to realised in terms of used wile expect uses. The the core issue is t prior to use), in order for that that high performance compute clusters

is just speed and power but also usage, productivity, correctness, and

reproducibility.

and nearly all scientific progra

GNU/Linux.

Add WeChat edu\_assist\_pro

The operating system and many applications are provided as "free and open source", which means that not only are there are some financial savings, were also much better placed to improve, optimize and maintain specific programs.

Free or open source software (not always the same thing) can be can be compiled from source for the specific hardware and operating system configuration, and can be optimised according to compiler flags. There is necessary where every clock cycle is important.

It is possible to illustrate the degree of parallelisation by using Flynn's Taxonomy of Computer Systems (1966), where each process is considered as the execution of a pool of instructions (instruction stream) on a pool of data (data stream).

Over time computing systems have moved towards multi-processor, multi-core, and often multi-threaded and multi-mode Project Exam Help systems.

https://eduassistpro.github.io/

The engineering imperative to t comes down to heat. From the middle owe Chat edu\_assist\_pro clock speed on CPUs have largely stalled.

Some trends include GPGPU development, massive multicore systems (e.g., The Angstrom Project, the Tile CPU with 1000 cores) and massive network connectivity and shared resources (e.g., Plan9 Operating System).

(Image from Dr. Mark Meyer, Canisius College)

Parallel programming and multicore systems should mean better performance. This can be expressed a ratio called speedup

Speedup (p) = Time (serial) / Time (parallel)

Correctness in parallelisation Signment Project Exam Help requires synchronisation (lockin Synchronisation and atomic operations causes loss of performance, communication latency.

Add WeChat edu\_assist\_pro

Amdahl's law, establishes the maximum improvement to a system when only part of the system has been improved. Gustafson and Barsis noted that Amadahl's Law assumed a computation problem of fixed data set size.

A detailed review was conducted in 2016 looking at the infrastructure of the Melbourne Research Cloud, High Performance Computing, and Research Data Storage Services. University desired a 'more unified experience to access compute services'

Recommended solution, Passignmento Project Exam Help usage, is to make use of existin cloud with an expansion of genhttps://eduassistpro.github.io/provisioning and use of a small on bare metal nodes.

Add WeChat edu\_assist\_pro

The 'bare metal' HPC component really will be laconic. "Real" HPC is a mere c276 cores, 21 GB per core. 2 socket Intel E5-2643 v3 CPU with 6-core per socket, 192GB memory, 2x 1.2TB SAS drives, 2x 40GbE network. "Cloud" partitions is almost 400 virtual machines with over 3,000 cores. There is also a GPU partition (big expansion this year), and departmental partitions (water and ashley).

This is not a big cluster by international standards! c.f., *The Provision of HPC Resources to Top Universities http://levlafayette.com/node/528* 

But it is important! Spartan and the model of an HPC-Cloud Hybrid has been featured at Multicore World, Wellington, 2016, 2017; eResearchAustralasia 2016, Center for Scientific Computing (CSC) Goethe University Frankfurt, 2016, High Performance Computing Center (HLRS) University of Stutter 1900 Performance Computing Center (HLRS) University Freiburg, 2016; Eur Research (CERN), 2016, Centre Informatique National de l'Ens https://eduassistpro.geth2016j6/entro Nacional de Supercomputación, Barcelona, it, Barcelona 2016.

Spartan (like Edward) uses its own authentication that is tied to the university Security Assertion Markup Language (SAML). The login URL is `https://dashboard.hpc.unimelb.edu.au/karaage`

Assignment Project Exam Help
Users on Spartan must belong to a project. Projects must be led by a University of Melbourne researcher (the "Principal Invest https://eduassistpro.github.io/

Participants in a project can be research to Chat edu\_assist from Onywhere.

The University, through Research Platforms, has an extensive training programme for researchers who wish to use Spartan. This includes day-long courses in "Introduction to Linux and HPC Using Spartan", "Edward to Spartan Transition Workshop", "Linux Shell Scripting for High Performance Computing", and "Parallel Programming On Spartan".

To log on to a HPC system, you will need a user account and password and a Secure Shell (ssh) client. Most HPC cluster administrators do not allow connections with protocols such as Telnet, FTP or RSH as they insecurely send passwords in plain-text over the network, which is easily captured by packet analyser tools (e.g., Wireshark). Linux distributions almost always include SSH as part of the default installation as does Mac OS 10.x, although you may also wish to use the Fugu SSH client. For Ma-Windows users the freet PLTX client is recommended. To transfer files use scp, WinSCP, Filezilla, and especially rsync.

Logins to Spartan are based on https://eduassistpro.github.io/

ssh your-username@spartanddpWaChat edu\_assist\_pro

Note `spartan2`. This is a second login node that was created specifically for this class.

For help go to http://dashboard.hpc.unimelb.edu.au or check `man spartan`. Lots of example scripts at `/usr/local/common`

Need more help? Problems with submitting a job, need a new application or extension to an existing application installed, if job generated unexpected errors etc., an email can be sent to: hpc-support@unimelb.edu.au`

Assumption here is that everyone has had exposure to the Linux command line. If not, you'd better get some! At least learn the twenty or so basic environment commands to navigate the environment, manipulate files, manage processes. Plenty of good online material available (e.g., my book "Supercomputing with Entry Clect. Example Clect.")

Environment modules provide f https://eduassistpro.glthusp'ijop/vironment (e.g., paths) via module files. Each m nfiguration information for the user's session to operate according apporting that edu\_assist, such as the location of the application's executables, its manual path, the librar forth.

Modulefiles also have the advantages of being shared with many users on a system and easily allowing multiple installations of the same application but with different versions and compilation options. Sometimes users want the latest and greatest of a particular version of an application for the feature-set they offer. In other cases, such as someone who is participating in a research project, a consistent version of an application is desired. Having multiple version of applications available on a system is essential in research computing.

Some basic module commands include the following:

module help

The command module help, by itself, provides a list of the switches, subcommands, and subcommand arguments that a subcommand the through the environment modules package.

module avail <a href="https://eduassistpro.github.io/">https://eduassistpro.github.io/</a> This option lists all the modules

This option provides a description of the module listed.

module display <modulefile>

Use this command to see exactly what a given modulefile will do to your environment, such as what will be added to the PATH, MANPATH, etc. environment variables.

module load <modulefile>
This adds one or more modulefiles to the user's current environment (some modulefiles load other modulefiles.

module unload <modulefilessignment Project Exam Help
This removes any listed modules from the user's
current environment.

https://eduassistpro.github.io/

module switch <modulefile1> <modulefile2>
This unloads one modulefile (modulefile4) another (modulefile2).

module purge

This removes all modules from the user's environment.

In the lmod system as used on Spartan there is also "module spider" which will search for all possible modules and not just those in the existing module path.

(Image from NASA, Apollo 9 "spider module")

The Portable Batch System (or simply PBS) is a utility software that performs job scheduling by assigning unattended background tasks expressed as batch jobs among the available resources. The scheduler provides for paramterisation of computer resources, an automatic submission of execution tasks, and a notification system for incidents.

The original Portable Batch System was developed NPX Tech Mely Solutions under contract to NASA in the early 1990s. In 1998 the original version of PBS was released as an open-source product as OpenPBS. This was f developed TORQUE (Terascale original engineering team and what commercial pro from the original product is now part of Altair Engineering whole of the popular job scheduler Slurm (originally "Simple Linux Utility for Resource Management"), now simply called Slurm Workload Manager, also uses batch script where are very similar in intent and style to PBS scripts.

Spartan uses the Slurm Workload Manager. A job script written on one needs to be translated to another (handy script available pbs2slurm https://github.com/bjpop/pbs2slurm)

In addition to this variety of implementations of PBS different institutions may also make further elaborations and specifications to their submission filters (e.g., site-specific queues, user projects for accounting). (Image from the otherwise dry IBM 'Red Book' on Queue Management)

Assignment Project Exam Help

https://eduassistpro.github.io/

Add WeChat edu\_assist\_pro

Submitting and running jobs is a relatively straight-forward process consisting of:

- 1) Setup and launch
- 2) Job Control, Monitor results
- 3) Retrieve results and analyse.

## Don't run jobs on the login node! Hearth paueuing Eystem to submit jobs.

ly makes resource requests and 1. Setup and launch consists of then commands, and optionally https://eduassistpro.github.io/

Core command for checking queue: We Strate edu\_assist\_pro Alternative command for checking queue: showq

sbatch [jobscript] Core command for job submission:

2. Check job status (by ID or user), cancel job.

Core command for checking job in Slurm: squeue -j [jobid]

Detailed command in Slurm: scontrol show job [jobid]

scancel [jobid] Core command for deleting job in Slurm:

3. Slurm provides an error and output files They may also have files for post-job processing. Graphic visualisation is best done on the desktop.

The script first invokes a shell education the job will run on (the default is 'cloud' for Spartan). Thttps://eduassistpro.grequests, Specifically for one compute node, one task.

Add WeChat edu\_assist\_pro

After these requests are allocated, the script loads then runs the executable against the dataset specified. Slurm also automatically exports your environment variables when you launch your job, including the directory where you launched the job from. If your data is a different location this has to be specified in the path!

After the script is written it can be submitted to the scheduler.

[lev@spartan]\$ sbatch myfirstjob.slurm

Modifying resource allocation requests can improve job efficiency.

For example shared-memory multithreaded jobs on Spartan (e.g., OpenMP), modify the --cpus-per-task to a maximum of 8, which is the maximum number of cores on a single instance.

```
#SBATCH --cpus-per-task=8
```

For distributed-memory multicores on using message passing, the multinode partition has to be invoked and the resource reque

```
https://eduassistpro.github.io/
#!/bin/bash
#SBATCH -p physical
#SBATCH --nodes=2
#SBATCH -ntasks-per-node=4
module load my-app-compiler/version
srun my-mpi-app
```

Note that multithreaded jobs *cannot* be used in a distributed memory model across nodes. They can however exist be conducted on distributed memory jobs which include a shared memory component (hybrid OpenMP-MPI jobs).

Alternative job submissions include specifying batch arrays, and batch dependencies.

In the first case, the same batch script, and therefore the same resource requests, is used multiple times. A typical example is to apply the same task across multiple datasets. The following example submits 10 batch jobs with myapp running against datasets dataset1.csv, dataset2.csv, ... dataset10.csv

## Assignment Project Exam Help

```
#SBATCH --array=1-10
myapp ${SLURM_ARRAY_TAS} https://eduassistpro.github.io/
```

In the second case a dependency condition is esta depends, creating a conditional produce V be depet edu\_assists project of `after`, `afterok`, `afternotok`, `beforeok`, `beforenotok`. A t e is where the output of one job is required as the input of the next job.

```
#SBATCH --dependency=afterok:myfirstjobid mysecondjob
```

For real-time interaction, with resource requests made on the command line, an interactive job is called. This puts the user on to a compute node.

This is typically done if they user wants to run a large script (and shouldn't do it on the login node), or wants to test or debug a job. The following command would launch one node with two processors for ten minutes.

Assignment Project Exam Help

```
[lev@spartan interact]$ --ntasks-per-node=2 srun: job 164 queued an https://eduassistpro.github.io/srun: job 164 has been [lev@spartan-rc002 interactd$WeChat edu_assist_pro
```

In almost all cases it is much better to do computation on the cluster and visualisation on a local system. In some cases however it is unavoidable to require x-windows forwarding.

It is best to login with the -Y option for security and then to login with -X to the login notes ignoremate project the Help then pass through the graphics via the login node to the desktop system.

https://eduassistpro.github.io/

Please note that you will need an x-windows client your desktop for the visualisation  $AddWeChat\ edu\_assist\_pro$

DDC

One form of parallel programming is multithreading, whereby a master thread forks a number of sub-threads and divides tasks between them. The threads will then run concurrently and are then joined at a subsequent point to resume normal serial application.

One implementation of multithreading is OpenMP (Open Multi-Processing). It is an Application Program Interface that includes directives for multi-threaded, shared memory parallel programming. The directives are included in the Corporation spurpersode and in a system where OpenMP is not implemented, they would be interpreted as comments.

There is no doubt that OpenMP <a href="https://eduassistpro.githaubiri@">https://eduassistpro.githaubiri@</a>/however it is limited to a single system unit (no distributed memory) and drather than using message passing. Many examples in `/us/decwectmat edu assist pro

(image from: User A1, Wikipedia)

```
#include <stdio.h>
#include "omp.h"
int main(void)
   int id;
   #pragma omp parallel num threads(8) private(id)
                   Assignment Project Exam Help
   int id = omp get thread num();
   printf("Hello world
                        https://eduassistpro.github.io/
return 0;
                        Add WeChat edu_assist_pro
program hello2omp
   include "omp lib.h"
   integer :: id
   !$omp parallel num threads(8) private(id)
     id = omp get thread num()
          print *, "Hello world", id
   !$omp end parallel
end program hello2omp
```

Moving from shared memory to parallel programming involves a conceptual change from multithreaded programming to a message passing paradigm. In this case, MPI (Message Passing Interface) is one of the most well popular standards and is used here, along with a popular implementation as OpenMPI.

The core principle is that Analygor processors Provided: Exam Help able cooperate to solve a problem by passing messages to each through a common co https://eduassistpro.github.io/

The flexible architecture does overcome serial bottlenecks, but it also does required that edu\_assist\_pro programmer effort (the "questing beast" of automatic parallelisation remains somewhat elusive).

The programmer is responsible for identifying opportunities for parallelism and implementing algorithms for parallelisation using MPI.

```
#include <stdio.h>
#include "mpi.h"
int main( argc, argv )
int argc;
char **argv:
  MPI_Init( &argc, &argv ); Assignment Project Exam Help
  MPI Comm size(MPI COMM
  MPI_Comm_rank( MPI_COMM https://eduassistpro.github.io/printf( "Hello world from process" https://eduassistpro.github.io/
  MPI Finalize();
                                 Add WeChat edu_assist_pro
  return 0;
    Fortran MPI Hello World
    program hello
    include 'mpif.h'
    integer rank, size, ierror, tag, status(MPI STATUS SIZE)
    call MPI INIT(ierror)
    call MPI COMM SIZE(MPI COMM WORLD, size, ierror)
    call MPI COMM RANK(MPI COMM WORLD, rank, ierror)
     print*, 'node', rank, ': Hello world'
    call MPI FINALIZE(ierror)
    end
```

The OpenMP example needs to be compiled with OpenMP directives. The OpenMP example cannot run across compute nodes; therefore it is best run on the "cloud" partition. The OpenMPI compilation needs to call the MPI wrappers.

```
module load OpenMPI/1.10.0-GCC-4.9.2
gcc -fopenmp helloomp.c -o helloompc
mpigcc mpihelloworldsgignmeine Projectd Exam Help
#!/bin/bash
                      https://eduassistpro.github.io/

mpiexec mpi-helloworld
```

Java can be compiled with MPI bindings; we have done this with OpenMPI/3.0.0 only. A more common option is to use MPJ-Express. The following "HellowWorld.java" program is compiled and executed.

```
import mpi.*;
public class HelloWorld {
public static void Ansing Strient Project Exam Eksprtion {
        MPI.Init(args);
        int me = MPI.C
        int size = MPI https://eduassistpro.github.io/
        System.out.println("Hi from
        MPI.Finalize(); Add WeChat edu assist pro
        }
sinteractive --time=1:00:00 --nodes=1 --ntasks=2
module load MPJ-Express
javac -cp .:/usr/local/easybuild/software/MPJ-Express/0.44-goolf-
2015a-Java-9.0.4/lib/mpj.jar HelloWorld.java
mpjrun.sh -np 2 HelloWorld
```

Python too has various MPI bindings available. The most common used is MPI4Py. Sample assignment data is provided from the 2016 and 2015 in the Spartan directory, `/usr/local/common`. As a package it can be simply imported (e.g., `from mpi4py import MPI`).

But remember! With environment modules with extensions you do not necessarily get all the packages/libraries/extensions/extensions already installed.

Examples provided in the direchttps://eduassistpro.github.io/ Python jobs with MPI bindings with Slurm submissions scripts for single-cerel due Verel due Ve

The actual Python script for the above is `twitter\_search\_541635.py`

A very popular and basic use of MPI Send and Recv routines is a ping-ping program. Why? Because it can be used to test latency within and between nodes and partitions if they have different interconnect (like on Spartan).

An example is given in `/usr/local/common/MPI` as `mpi-pingpong.c` with a job submission script that can be modified accord to the test case `mpi-pingpong.slurm`. There are some routines here which manage the pamential property as `mpi-pingrop of the property of the pro

MPI\_Status() MPI\_Status is attached to an MPI Recv() rouhttps://eduassistpro.github.io/

MPI\_Request() A wrapper for Artel Represtant edu\_assistany maitall, waitsome, start, cancel, startall.

MPI\_Barrier() Enforces synchronisation between MPI processes in a group by placing a barrier on communication between groups. An MPI barrier completes after all group members have entered the barrier.

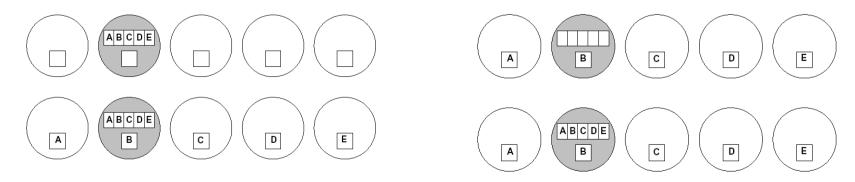

MPI\_Wtime() - Returns an elapsed time as a floating-point number of seconds on the calling processor from an arbitrary time in the past.

There are *many* other MPI routines which are *not* going to explored here! However just as a little taste one of the most popular is MPI collective communications and reduction operations. Collective communications include MPI\_Broadcast, MPI\_Scatter, MPI\_Gather, MPI\_Reduce, and MPI\_Allreduce.

MPI\_Bcast Broadcasts a message from the process with rank "root" to all other processes of the communicator, including is eight the significant the communicator.

MPI\_Scatter sends data fro https://eduassistpro.gliphible/and each process executed a receive. MPI\_Scattery scatters a bu all tasks in a group.

Add WeChat edu\_assist\_pro

MPI\_Reduce performs a reduce operation (such as sum, max, logical AND, etc.) across all the members of a communication group.

MPI\_Allreduce conducts the same operation but returns the reduced result to all processors.

Assignment Project Exam Help²

the NPI\_Allreduce conducts the signment Project Exam Help²

the reduced result to all processors.

Add WeChat edu\_assist\_pro

RANK

ABCD

I J K L

MPI\_ALLREDUCE

The general principle in Reduce and All Reduce is the idea of reducing a set of numbers to a small set via a function. If you have a set of numbers (e.g., [1,2,3,4,5]) a reduce function (e.g., sum) can convert that set to a reduced set (e.g., 15). MPI\_Reduce takes in an array of values as that set and outputs the result to the root process. MPI\_AllReduce outputs the result to all processes.
